Report Number	6
Customer Details	Green Vallex FOOds | 8999999 | 333
Condition Upon Receipt	jjjjj
No of Samples	1
Parameter(s) Tested	Total Viable Count (TVC)

Job Reference Number	dd
Date Sampled	2026-10-07
Date Analyzed	2026-10-07
Date Reported	2026-10-07

MICROBIOLOGY RESULTS

MICROSCOPY RESULTS

Microbiology Parameter	Unit	Result
Total Viable Count (TVC)	ee	eee

Disclaimer

1) Scope of Testing

This report relates only to the specific sample identified in this report and to the analytes tested. It does not constitute certification or approval of the entire batch/consignment or any other lots, and it should be interpreted together with the stated sample description and condition on receipt.

2) Sampling and representativeness

Unless BIOTECH personnel performed sampling under a documented sampling plan, the selection, collection, sealing, labelling, and transport of the sample are the responsibility of the client (or its appointed agent). Accordingly, the results reflect the test portion of the sample submitted and may not represent the whole batch where the product is heterogeneous or where sampling was not statistically representative.

3) Methods, reporting limits and uncertainty

Analyses were performed using the method(s) stated in this report. All analytical measurements have inherent uncertainty. Results reported with a "<" sign indicate that the analyte was not detected above the method reporting limit stated in the result table. Where regulatory enforcement, dispute resolution, or importing-country requirements demand confirmatory testing by a reference method, BIOTECH can advise and/or facilitate confirmatory analysis upon request.

4) Regulatory interpretation

Any "Allowed Limit" values and compliance statements are made only against the specific limits referenced in this report. Regulatory limits and decision rules may differ by jurisdiction, commodity definition, intended use (food vs. feed), and importing authority; the client remains responsible for determining and meeting all applicable legal requirements in the destination market and in Zimbabwe.

5) Reliance, distribution and reproduction

This report is issued exclusively for the client named herein for its quality, regulatory, and risk-management purposes. No third party may rely on this report without BIOTECH's prior written consent. Reproduction is permitted only in full and unaltered form. Extracts, partial reproduction, or use for advertising/marketing claims (including certified/approved) is not permitted without BIOTECH's written approval.

6) Limitation of liability

To the maximum extent permitted by applicable law, BIOTECH's total liability arising from or connected with the services and this report (whether in contract, delict/tort, negligence or otherwise) is limited to the fees paid for the specific testing giving rise to the claim. BIOTECH shall not be liable for indirect, consequential, special or economic losses (including loss of profit, recall costs, loss of market, or business interruption). Nothing in this disclaimer limits liability for fraud, willful misconduct, or any liability that cannot lawfully be excluded.

7) Queries and retention (if applicable)

Any questions, requests for re-testing, or disputes regarding this report should be raised promptly and, where possible, before the sample/test portion is disposed of in accordance with laboratory retention and disposal procedures.

NOTES

- Presence/Absence Tests: Qualitative methods used to determine whether specific indicator organisms or pathogens (e.g., Escherichia coli, Salmonella spp., fecal coliforms) are detected in the sample.
- Absence: Indicates microbiological compliance for potable water standards.
- Presence: Indicates contamination and potential public health risk; the water is considered unsafe for human consumption without treatment.
- Fecal Coliforms and E. coli: Indicator organisms used to assess fecal contamination of water. Their presence suggests possible contamination from human or animal waste and the potential presence of enteric pathogens.
- Salmonella spp.: A pathogenic organism. Its detection in water indicates serious contamination and renders the water unsuitable for consumption.
- Membrane Filtration Method: A standard technique used for microbiological analysis of water, allowing detection and enumeration of microorganisms by filtering a defined volume of sample through a membrane and culturing on selective media.
- Sample Integrity: Results apply only to the sample as received. Improper sampling, storage, or transport conditions may affect microbial recovery.
- Public Health Consideration: The presence of indicator organisms or pathogens suggests that the water source may be compromised and requires corrective action such as disinfection, source protection, or further investigation.

SUMMARY OF TEST METHODS

Element / Parameter	Method Code	Method of Analysis
Total Viable Count	FSH-MICRO-01	Miles and Misra method
Enumeration of Coliforms	FSH-MICRO-02	Miles and Misra method
Enumeration of Escherichia coli	FSH-MICRO-02	Miles and Misra method
Enumeration of Bacillus cereus	FSH-MICRO-12	Miles and Misra method
Enumeration of Coagulase Positive Staphylococci	FSH-MICRO-07	Miles and Misra method
Detection of Salmonella spp.	FSH-MICRO-04	Pre-enrichment followed by plating on selective agar
Enumeration of Yeasts and Moulds	FSH-MICRO-11	Miles and Misra method
Enumeration of Lactic Acid Bacteria	FSH-MICRO-11	Miles and Misra method
